

# Web Application-MVC

# Session Objective

- MVC Architecture

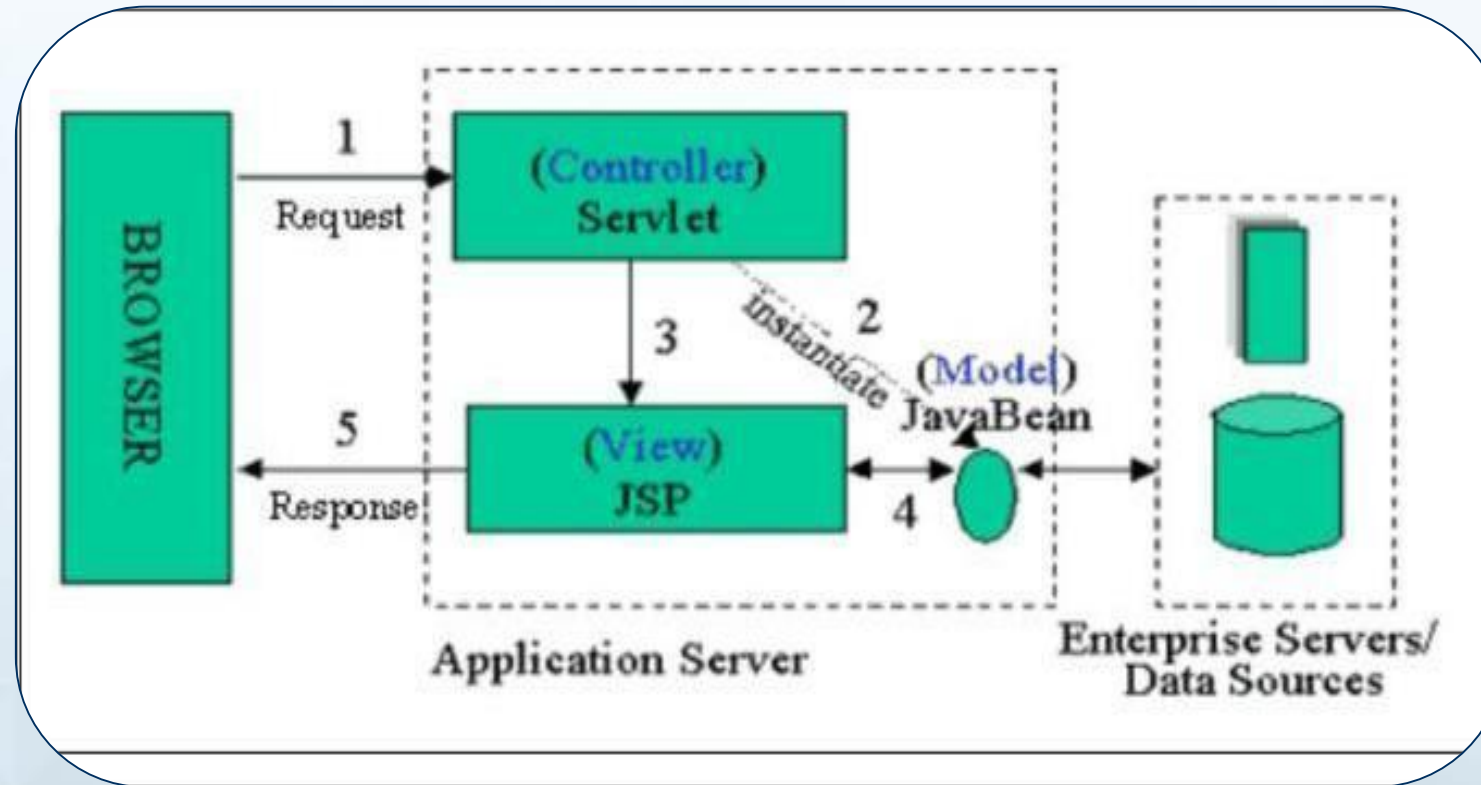

# MVC

- **MVC** stands for Model View and Controller.
- MVC is a **design pattern** that separates the business logic, presentation logic and data.
- **Controller** acts as an interface between View and Model. Controller intercepts all the incoming requests.
- **Model** represents the state of the application i.e. data. It can also have business logic.
- **View** represents the presentation i.e. UI(User Interface).

# Advantage of MVC

- Navigation Control is centralized
- Easy to maintain the large application

# MVC Architecture

# Simple Example for MVC

- index.jsp a page that gets input from the user.
- ControllerServlet.java a servlet that acts as a controller.
- login-success.jsp and login-error.jsp files acts as view components.
- web.xml file for mapping the servlet.

# Index.jsp

```
<form action="ControllerServlet" method="post">  
Name:<input type="text" name="name"><br>  
Password:<input type="password" name="password"><br>  
<input type="submit" value="login">  
</form>
```

# ControllerServlet.java

```
package com.hexa;
import java.io.IOException;
import java.io.PrintWriter;
import javax.servlet.RequestDispatcher;
import javax.servlet.ServletException;
import javax.servlet.http.HttpServlet;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletResponse;
public class ControllerServlet extends HttpServlet {
    protected void doGet(HttpServletRequest request,
        HttpServletResponse response)
        throws ServletException, IOException {
        response.setContentType("text/html");
        PrintWriter out=response.getWriter();

        String name=request.getParameter("name");
        String password=request.getParameter("password");
```

```
        LoginBean bean=new LoginBean();
        bean.setName(name);
        bean.setPassword(password);
        request.setAttribute("bean",bean);

        boolean status=bean.validate();

        if(status){
            RequestDispatcher
            rd=request.getRequestDispatcher("login-success.jsp");
            rd.forward(request, response);
        }
        else{
            RequestDispatcher
            rd=request.getRequestDispatcher("login-error.jsp");
            rd.forward(request, response);
        }
    }
}
```

# LoginBean.java

```
package com.hexa;

public class LoginBean {
    private String name,password;

    public String getName() {
        return name;
    }

    public void setName(String name) {
        this.name = name;
    }
}
```

```
package com.hexa;

public String getPassword() {
    return password;
}

public void setPassword(String password) {
    this.password = password;
}

public boolean validate(){
    if(password.equals("admin")){
        return true;
    }
    else{
        return false;
    }
}
}
```

# Success and error page

## Login-success.jsp

```
<%@page import="com.hexa.LoginBean"%>

<p>You are successfully logged in!</p>

<%
LoginBean
bean=(LoginBean)request.getAttribute("bean");
out.print("Welcome, "+bean.getName());
%>
```

## Login-error.jsp

```
<p>Sorry! username or password
error</p>

<%@ include file="index.jsp" %>
```
